

COMP 1002

Intro to Logic for Computer Scientists

Lecture 10

Puzzle 9

- Susan is 28 years old, single, outspoken, and very bright. She majored in philosophy. As a student she was deeply concerned with issues of discrimination and social justice and also participated in anti-nuke demonstrations.

Please rank the following possibilities by how likely they are. List them from least likely to most likely. Susan is:

1. a kindergarden teacher
2. works in a bookstore and takes yoga classes
3. an active feminist
4. a psychiatric social worker
5. a member of an outdoors club
6. a bank teller
7. an insurance salesperson
8. a bank teller and an active feminist

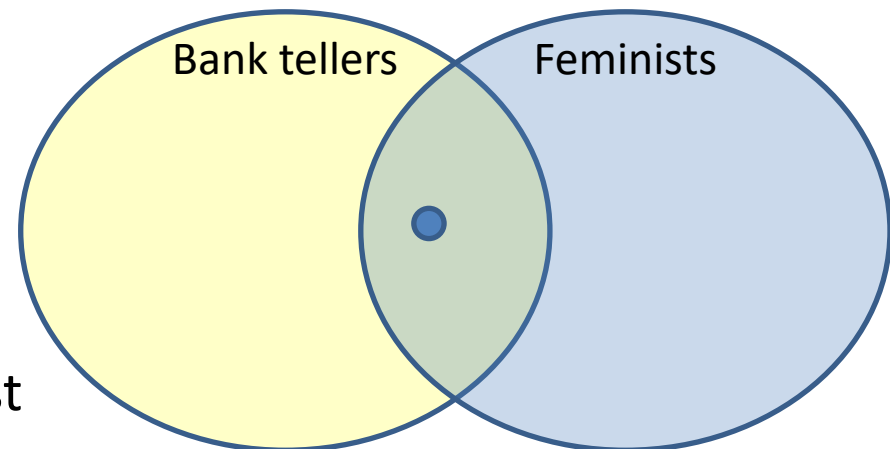

Puzzle 9

- Susan is 28 years old, single, outspoken, and very bright. She majored in philosophy. As a student she was deeply concerned with issues of discrimination and social justice and also participated in anti-nuke demonstrations.

Please rank the following possibilities by how likely they are. List them from least likely to most likely. Susan is:

1. a kindergarden teacher
2. works in a bookstore and takes yoga classes
3. an active feminist
4. a psychiatric social worker
5. a member of an outdoors club
6. a bank teller
7. an insurance salesperson
8. a bank teller and an active feminist

Sets

- A **set** is a collection of objects.
 - $S_1 = \{1, 2, 3\}$, $S_2 = \{\text{Cathy, Alaa, Keiko, Daniela}\}$
 - $S_3 = [-1, 2]$ (real numbers from -1 to 2, inclusive)
 - $\text{PEOPLE} = \{x \mid x \text{ is a person living on Earth now}\}$
 - $\{x \mid \text{such that } x \dots\}$ is called **set builder notation**
 - $S_4 = \{(x,y) \mid x \text{ and } y \text{ are people, and } x \text{ is a parent of } y\}$
 - $\text{BANKTELLERS} = \{x \mid x \text{ is a person who is a bank teller}\}$
- The order of elements does not matter.
- There are no duplicates.

Special sets

- Notation for some special sets (much of which you are likely to have seen):
 - Empty set \emptyset
 - Natural numbers $\mathbb{N} = \{1, 2, 3, \dots\}$ (sometimes with 0)
 - Integers $\mathbb{Z} = \{\dots - 2, -1, 0, 1, 2, \dots\}$
 - Rational numbers $\mathbb{Q} = \left\{ \frac{m}{n} \mid m, n \text{ in } \mathbb{Z}, n \neq 0 \right\}$
 - Real numbers \mathbb{R}
 - complex numbers \mathbb{C}

Set elements

- $a \in S$ means that an element a is in a set S , and $a \notin S$ that a is not in S . That is, $a \in S \equiv \neg (a \notin S)$
 - Susan \in PEOPLE. Susan \notin BANKTELLERS
 - $0.23 \in [-1, 2]$. $3.54 \notin [-1, 2]$
- Also, write $x \in S$ for a variable x .
 - BANKTELLERS = $\{ x \in PEOPLE \mid x \text{ is a bank teller} \}$
- How do we generalize sentences like “ x is a bank teller”, where x is an element of some set?

Predicates

- A **predicate** $P(x_1, \dots, x_n)$ is a “proposition with variables”, where values of the variables x_1, \dots, x_n come from some sets S_1, \dots, S_n , called their **domains** or **universes**.
 - $P(x)$ is true for some values of $x \in S$, and false for the rest.
 - $\text{Even}(x)$ for $x \in \mathbb{Z}$, $\text{Feminist}(y)$ for $y \in \text{PEOPLE} \dots$
 - Here, domain of x is \mathbb{Z} , and domain of y is PEOPLE
 - $\text{Even}(y)$ is not defined for $y \in \text{PEOPLE}$, only for elements of \mathbb{Z} .
 - A predicate can have several variables:
 - $x > y$, for $x, y \in \mathbb{R}$
 - $\text{Divides}(x, y)$, which is true for $x, y \in \mathbb{Z}$ such that x divides y .
- When all variables in a predicate are replaced with specific elements (**instantiated**), the predicate becomes a proposition.
 - “ $\text{Even}(3)$ ” is false. “ $\text{Feminist}(\text{Susan})$ ” is true.

Negating the universal

- What is the negation of “All”? When would a statement “ $\forall x \in S, F(x)$ ” be false?
 - All girls hate math.
 - No!
 - All girls love math?
 - Some girls do not hate math!
 - Everybody in O’Brian family is tall
 - No, Jenny is O’Brian and she is quite short.
 - It is foggy all the time, every day in St. John’s
 - No, sometimes it is not foggy (like today).

Quantifiers in English

- Universal quantifier: usually “every”, “all”, “each”, “any”.
– Every day it is foggy. Each number is divisible by 1.
- Existential quantifier: “some”, “a”, “exists”
– Some students got 100% on both labs.
– There exists a prime number greater than 100.
- The word “any” can mean either!

Quantifiers in English: “any”

- “Any” can mean “every”:

– Any student in our class knows logic 😊

– Every student in our class knows logic. 😊

- But “any” can also mean “some”!

– I will be happy if I do well on every quiz. 😊

– I will be happy if I do well on any quiz. 😞

Puzzle 10

- The first formulation of the famous liar's paradox, attributed to a Cretan philosopher Epimenides, stated

“All Cretans are liars”.

Is this really a paradox?
