Table 2: Results of Study Five (Version 2).

Next to typesetting mathematics, typesetting tables is probably one of the more difficult aspects of LaTeX. However, basic tables are remarkably easy to do (see Table $1)$. Tables are centered on the page using the centering command (see Table 2); though blank rows can be inserted to improve readability, a much better mechanism is to use horizontal bars to separate columns (see Tables 3 and 4) and, if necessary, vertical bars to separate columns (see Table 5). Text spanning multiple columns is easy to do using the $\mathrm{itt}_{i}$ multicolumn $\mathrm{n}_{\mathrm{i}} / \mathrm{tt}_{i}$ command but must be done carefully (and may also require use use of the cline command) (see Tables 6 and 7 ). The final icing on the cake is to get even-width columns using "blank" lines with embedded hspace* command (see Table 8).
